AskWomen AskMen Classification

Subreddit comparison Sean Bjork

Problem Statement:

To build an accurate (over 70%) predictive model for classifying Subreddit posts as from either AskMen or AskWomen.

Number of questions:

- 684 from AskWomen (53.9%)
- (46.1%)585 from AskMen 1269 total

I feel like I only ever hear about these four men, but there must be women out there in the Celebsphere that elicit the same warmth, comfort and general wholesomeness that these guys do.

Reeves, Tom Hanks, and Mr Rogers, but who are the wholesome

Edit: Precious metals!? You're all as wholesome as the women you've mentioned!

internet women?

CREATE POST

Sample Questions with *Signal*

"What weird food craving did you have while pregnant? And what kind of food couldn't you stand anymore?"

'What makes a strong woman in your opinion? As in how can you tell she is strong?'

- AskWomen

AskMen

Early Process

Cleaning

- Removed undesired special characters
- Replaced "SO" with "sigoth" (significant other)
- Made all letters lowercase

Preprocessing

- Removed "stop words"
- Applied PorterStemmer
- Used vectorizers:
 - CountVectorizer
 - o **TFID**F

use love

Top words: **Women Only**

Top words: Men Only

help

Modeling

We used GridSearchCV to find best hyperparameters.

Logistic Regression Naive Bayes

Best model:

with CountVectorizer and TFIDF

Multinomial Naive Bayes

TFIDF & alpha = \sim 2.2

Best accuracy: 66.4%

Conclusions / Limitations

- There signal coming from our predictive features is significant.
- We failed to achieve accuracy of greater than 70%.
- Our model may perform better with more training data.

- We recommend modeling with Multinomial Naive Bayes
 - o TFIDF vectorizer.

- More data → Better model
- Tough to discern short questions with few / no distinguishing keywords
 - Both ask about "men" / "women"
